

Vantree Workflow — Release Notes

Document ID: PROD-DOC-07-RN | Version 3.6 | Last updated: May 2026 | Owner: Product Team

Release notes for Vantree Workflow, covering the three most recent minor version releases. For full historical changelogs, see the in-app Release Notes page under Settings → What's New.

v3.6 — May 2026

Fixed: Capacity planning heatmap was incorrectly showing team members as over-allocated when tasks from archived projects were still counted toward their weekly total. Archived project tasks are now excluded from allocation calculations.

Fixed: Slack notifications for automations occasionally failed silently when the connected Slack app's token had been rotated. The integration now surfaces a reconnect prompt in-app instead of failing silently.

Added: Gantt view now supports multi-select drag to shift several tasks' dates at once.

v3.5 — March 2026

Added: CSV export for weekly timesheets, available from Time Tracking → Export. Business and Enterprise tiers can also sync exports directly to supported payroll integrations.

Added: Custom fields on task cards, available on Business tier and above.

Changed: API rate limits increased from 300 to 600 requests per minute on the Business tier to support higher-volume integrations.

v3.4 — January 2026

Added: Automatic dependency detection in Gantt view — moving a task now prompts a suggested date shift for dependent tasks rather than requiring a manual update.

Fixed: Deleted tasks were, in rare cases, purged from Trash before the documented 30-day retention window. This has been corrected; retention is now reliably enforced at 30 days.

Changed: OAuth 2.0 client credentials tokens now expire after 24 hours instead of 7 days, requiring more frequent token refresh for server-to-server integrations.
