

Vantree Workflow — Product Documentation

Document ID: PROD-DOC-07 | Version 3.5 | Last updated: May 2026 | Owner: Product Team

1. Product Overview

Vantree Workflow is a project and resource management platform for mid-market operations teams. It combines task tracking, capacity planning, and lightweight time tracking in a single workspace, with integrations into Slack, Google Calendar, and common accounting tools.

2. Pricing Tiers

Tier	Price (per seat/month)	Seat Minimum	Key Limits
Starter	\$9	5	Up to 3 projects, 90-day history
Team	\$19	10	Unlimited projects, 1-year history
Business	\$34	25	Unlimited history, SSO, custom fields
Enterprise	Custom	100	Dedicated support, audit logs, SLA

3. Core Features

Task Boards: Kanban and Gantt views with drag-and-drop scheduling and automatic dependency detection.

Capacity Planning: managers can view team workload as a heatmap and rebalance tasks when a team member exceeds 100% allocation for a given week.

Time Tracking: optional per-task time logging that rolls up into weekly timesheets, exportable to CSV or synced directly to supported payroll integrations.

Automations: rule-based triggers (e.g., 'when a task moves to Done, notify the requester in Slack') configurable without code on the Team tier and above.

4. API Authentication

The Vantree Workflow API uses OAuth 2.0 with the client credentials flow for server-to-server integrations, and authorization code flow for user-facing apps. API keys are scoped per-workspace and can be rotated from Settings → Developer → API Keys.

Rate limits are 600 requests per minute per API key on the Business tier, and 1,200 requests per minute on Enterprise. Exceeding the limit returns an HTTP 429 with a Retry-After header.

5. Troubleshooting FAQ

Q: Why isn't my Slack integration posting notifications? — Check that the Vantree Slack app still has 'chat:write' scope authorized; scopes can be revoked if a workspace admin updates Slack app

permissions. Reconnect via Settings → Integrations → Slack.

Q: Why does capacity planning show a team member as over-allocated when their tasks look fine? — Capacity calculations include tasks from **all** projects the person is assigned to, not just the project currently open. Check their workload page under Team → Capacity for the full picture.

Q: Can I recover a deleted task? — Deleted tasks are retained for 30 days and can be restored from Project Settings → Trash. After 30 days they are permanently purged and cannot be recovered.
